

Human Review: finite-dimensional misreading

Packet identifier: 1705.06797_v12_superreflexive_finite_dim_literal_counterexample

Original automatic proof: solution_packet.pdf

Checked date: 13 June 2026

Status: Manually checked.

Verdict: Incorrect as a solution to the intended problem. This is a miss.

Human Comments

The proposed solution in `solution_packet.pdf` should not be accepted as a solution of Problem 5.1. It answers only a finite-dimensional loophole by taking the one-dimensional Banach space $\mathbb{R}$. That is not the problem the authors were asking.

The question was clearly intended for infinite-dimensional Banach spaces. The text immediately following the problem says that a counterexample would have to be a super-reflexive space without an unconditional basic sequence, and points to the Ferenczi-space context. This makes clear that the finite-dimensional case is not the intended mathematical target.

For that reason, this candidate has to be discarded. It does not answer the intended infinite-dimensional super-reflexive question and should be classified as an incorrect hit by the pipeline.

Short Version

This is a miss. The candidate exploits a finite-dimensional reading, whereas the intended question concerns infinite-dimensional Banach spaces.

Review Outcome

Discard this as a proposed solution of Problem 5.1. At most, archive it as a warning that automatic extraction must retain the surrounding context of an open problem.
