

A positive answer to Dales Question (II) for $c_0 \oplus \ell_\infty$

Smoke-test packet for `fa_banach_001`

2026-06-14

Status

This packet claims a full solution of the specific subquestion in Dales–Kania–Kochanek–Koszmider–Laustsen [1]: for

$$E = c_0 \oplus \ell_\infty,$$

every finitely-generated maximal left ideal of $\mathcal{B}(E)$ is fixed. It does not address the remaining $C(K)$ cases in [1], such as $C[0, 1]$ or $C[0, \alpha]$ for $\alpha \geq \omega^\omega$.

Source Question

In [1, Question (II)], Dales asks whether every finitely-generated maximal left ideal of $\mathcal{B}(E)$ is fixed. The same paper states on pages 23–24 that the answer was not known for $E = c_0 \oplus \ell_\infty$.

Then E^* is isomorphic to $(\bigoplus_{n \in \mathbb{N}} E_n^*)_{\ell_\infty}$, and so the conclusion is that each finitely-generated, maximal left ideal of $\mathcal{B}((\bigoplus E_n^*)_{\ell_\infty})$ is fixed.

The conditions imposed on the Banach space E in Theorems 5.8 and 5.11 are clearly preserved under the formation of finite direct sums. In contrast, this need not be the case for the condition of Corollary 5.3. For instance, c_0 and ℓ_∞ both satisfy this condition by Example 5.4(ii)–(iii), whereas their direct sum $c_0 \oplus \ell_\infty$ does not. We shall explore this situation in greater depth in Section 7. Notably, as a particular instance of Theorem 7.3, we shall see that the main conclusion of Corollary 5.3 fails for $E = c_0 \oplus \ell_\infty$ because $\mathcal{F}(c_0 \oplus \ell_\infty)$ is contained in a proper, closed, singly-generated left ideal of $\mathcal{B}(c_0 \oplus \ell_\infty)$.

We do not know the answer to Question (II) for $E = c_0 \oplus \ell_\infty$, but the following result answers this question positively for another direct sum arising

naturally from Example 5.4, with the ideal $\mathcal{S}(E)$ of strictly singular operators taking the role that was played by $\mathcal{F}(E)$ in Corollary 5.3 and $\mathcal{K}(E)$ in Theorem 5.8.

Proposition 5.13. *Let $E = c_0(\mathbb{I}) \oplus H$, where $\mathbb{I}$ is a non-empty set and H is a Hilbert space. Then $\mathcal{B}(E)$ is the only finitely-generated left ideal of $\mathcal{B}(E)$*

Definitions and Source Inputs

A maximal left ideal of $\mathcal{B}(E)$ is fixed if it has the form

$$\mathcal{ML}_x = \{T \in \mathcal{B}(E) : Tx = 0\}$$

for some non-zero $x \in E$. We use the following results from [1].

- The dichotomy theorem says that a non-fixed maximal left ideal contains $\mathcal{F}(E)$.
- The strong dichotomy, Corollary 4.1, says that a non-fixed maximal left ideal contains the ideal $\mathcal{E}(E)$ of inessential operators.
- Corollary 4.7 says that, for a finite generating family $\Gamma \subset \mathcal{B}(E)$, containment $\mathcal{F}(E) \subseteq \mathcal{L}_\Gamma$ is equivalent to the associated map

$$\Psi_\Gamma : E \rightarrow E^{|\Gamma|}, \quad \Psi_\Gamma x = (Tx)_{T \in \Gamma},$$

being bounded below.

- Lemma 7.1 says that every operator $\ell_\infty \rightarrow X$ is strictly singular whenever X contains no copy of ℓ_∞ .
- Proposition 7.8 says that, for $E = c_0 \oplus \ell_\infty$, the ideal

$$\mathcal{K}_1 = \left\{ \begin{pmatrix} A & B \\ C & D \end{pmatrix} \in \mathcal{B}(c_0 \oplus \ell_\infty) : A \in \mathcal{K}(c_0) \right\}$$

is not contained in any finitely-generated maximal left ideal of $\mathcal{B}(E)$.

Proof Intuition

A non-fixed finitely-generated maximal left ideal L would contain $\mathcal{F}(E)$, so the finite generator map is bounded below. Since $c_0 \oplus \ell_\infty$ is isomorphic to each of its finite powers, this places a bounded-below operator inside L . The strong dichotomy also places all inessential operators inside L . For $c_0 \oplus \ell_\infty$, the off-diagonal blocks are inessential, and the ℓ_∞ -to- c_0 block of a bounded-below operator is strictly singular. Therefore the lower right block is upper semi-Fredholm, and injectivity of ℓ_∞ lets one manufacture the lower-right identity projection inside L . Together with the inessential blocks this forces $\mathcal{K}_1 \subseteq L$, contradicting Proposition 7.8 of the source paper.

Lemma 1. *Let $E = c_0 \oplus \ell_\infty$. If L is a non-fixed maximal left ideal of $\mathcal{B}(E)$ and L contains a bounded-below operator, then $\mathcal{K}_1 \subseteq L$.*

Proof. Write operators on E in block form relative to $E = c_0 \oplus \ell_\infty$. Since L is non-fixed, the strong dichotomy [1, Corollary 4.1] gives $\mathcal{E}(E) \subseteq L$.

We first record the block consequences. Compact operators on c_0 are inessential. Every operator $\ell_\infty \rightarrow c_0$ is strictly singular by [1, Lemma 7.1], because c_0 contains no copy of ℓ_∞ ; hence such operators are inessential. By the standard symmetry property for inessential operators, used in [1, proof of Theorem 7.7] via Gonzalez [2], every operator $c_0 \rightarrow \ell_\infty$ is also inessential. Finally, weakly compact operators on ℓ_∞ are inessential. Thus L contains every block matrix

$$\begin{pmatrix} A & B \\ C & D \end{pmatrix} \quad \text{with} \quad A \in \mathcal{K}(c_0), B \in \mathcal{B}(\ell_\infty, c_0), C \in \mathcal{B}(c_0, \ell_\infty), D \in \mathcal{W}(\ell_\infty).$$

Let

$$R = \begin{pmatrix} R_{11} & R_{12} \\ R_{21} & R_{22} \end{pmatrix} \in L$$

be bounded below. Restricting R to the ℓ_∞ -summand shows that the column map

$$y \mapsto (R_{12}y, R_{22}y), \quad \ell_\infty \rightarrow c_0 \oplus \ell_\infty,$$

is bounded below, hence upper semi-Fredholm. The operator R_{12} is strictly singular, so stability of upper semi-Fredholm operators under strictly singular perturbations gives that R_{22} is upper semi-Fredholm.

Choose a finite-rank projection $Q \in \mathcal{B}(\ell_\infty)$ onto $\ker R_{22}$. The restriction of R_{22} to $\ker Q$ is an isomorphism onto its closed range. Since ℓ_∞ is injective, the inverse on $R_{22}(\ker Q)$ extends to an operator $S \in \mathcal{B}(\ell_\infty)$, and so

$$SR_{22} = I_{\ell_\infty} - Q.$$

As $R \in L$, we have

$$\begin{pmatrix} 0 & 0 \\ 0 & S \end{pmatrix} R = \begin{pmatrix} 0 & 0 \\ SR_{21} & I_{\ell_\infty} - Q \end{pmatrix} \in L.$$

The off-diagonal block $SR_{21} : c_0 \rightarrow \ell_\infty$ is inessential, and Q is finite-rank, hence weakly compact. Both corresponding block operators belong to L . Therefore

$$P_2 := \begin{pmatrix} 0 & 0 \\ 0 & I_{\ell_\infty} \end{pmatrix} \in L.$$

Left-multiplying P_2 by arbitrary lower-right block matrices gives every operator of the form

$$\begin{pmatrix} 0 & 0 \\ 0 & D \end{pmatrix}, \quad D \in \mathcal{B}(\ell_\infty).$$

Adding the inessential upper-left compact and off-diagonal blocks recorded above yields $\mathcal{K}_1 \subseteq L$. $\square$

Theorem 1. *Every finitely-generated maximal left ideal of $\mathcal{B}(c_0 \oplus \ell_\infty)$ is fixed.*

Proof. Let $E = c_0 \oplus \ell_\infty$, and suppose toward a contradiction that L is a non-fixed finitely-generated maximal left ideal of $\mathcal{B}(E)$. Choose a finite generating set Γ with $L = \mathcal{L}_\Gamma$. By the dichotomy theorem, $\mathcal{F}(E) \subseteq L$. Corollary 4.7 of [1] implies that $\Psi_\Gamma : E \rightarrow E^{|\Gamma|}$ is bounded below.

For every $n \in \mathbb{N}$, $c_0^n \cong c_0$ and $\ell_\infty^n \cong \ell_\infty$, hence $E^n \cong E$. Taking an isomorphism $A : E^{|\Gamma|} \rightarrow E$, the operator

$$R = A\Psi_\Gamma$$

is bounded below and belongs to L . Lemma 1 gives $\mathcal{K}_1 \subseteq L$. This contradicts [1, Proposition 7.8], which states that $\mathcal{K}_1$ is not contained in any finitely-generated maximal left ideal of $\mathcal{B}(c_0 \oplus \ell_\infty)$. Thus no such non-fixed L exists. $\square$

Verification and Novelty Check

No computation is used. The proof is a formal combination of source-paper theorems plus Lemma 1. The local run indexes

```
registry_index.tsv, solutions/index.tsv
attempts/index.tsv, proof_gaps/index.tsv
```

were searched for arXiv 1208.4762, DalesQ1, $c_0 \oplus \ell_\infty$, and maximal-left-ideal keywords; no duplicate packet was found. Web searches on 2026-06-14 for exact phrases involving DalesQ1, $c_0 \oplus \ell_\infty$, $C[0, 1]$, and finitely-generated maximal left ideals found the source paper but no later exact answer.

Novelty confidence is moderate. The packet relies heavily on [1], especially Proposition 7.8, and should be reviewed as a short corollary-style completion of the stated $c_0 \oplus \ell_\infty$ subquestion. It does not settle the broader $C(K)$ cases.
